

EnvEvidence | Synthetic research fixture

NOT A REAL PUBLICATION. Invented values for software testing only.

This original example is distributed under the repository MIT license.

Study: water treatment using three distinct experimental conditions.

Reported removal refers to the target pollutant. TOC removal is a separate endpoint.

Reagent doses for Trials A and B are reported in the accompanying supplement.

Do not use these invented values for research conclusions or method recommendations.

Results | Trials A and B

Trial A: acetaminophen in synthetic water, initial concentration 10 mg/L.

Trial A used UV/H₂O₂ at pH 7.0 for 30 min.

Trial A: acetaminophen removal was 85%; TOC removal was 20%.

Trial B: acetaminophen in synthetic water, initial concentration 10 mg/L.

Trial B used H₂O₂ in the dark at pH 7.0 for 30 min.

Trial B: acetaminophen removal was 12%; TOC removal was 2%.

These results belong to separate treatment arms and must not be merged.

Results | Trial C

Trial C: sulfamethoxazole in real wastewater, initial concentration 5 mg/L.

Trial C used UV/H₂O₂ at pH 6.5 for 60 min.

Trial C: H₂O₂ dose was 15 mg/L.

Trial C: sulfamethoxazole removal was 64%.

The fixture provides no TOC endpoint for Trial C.
